

Renuvion[®] Physician Survey Results

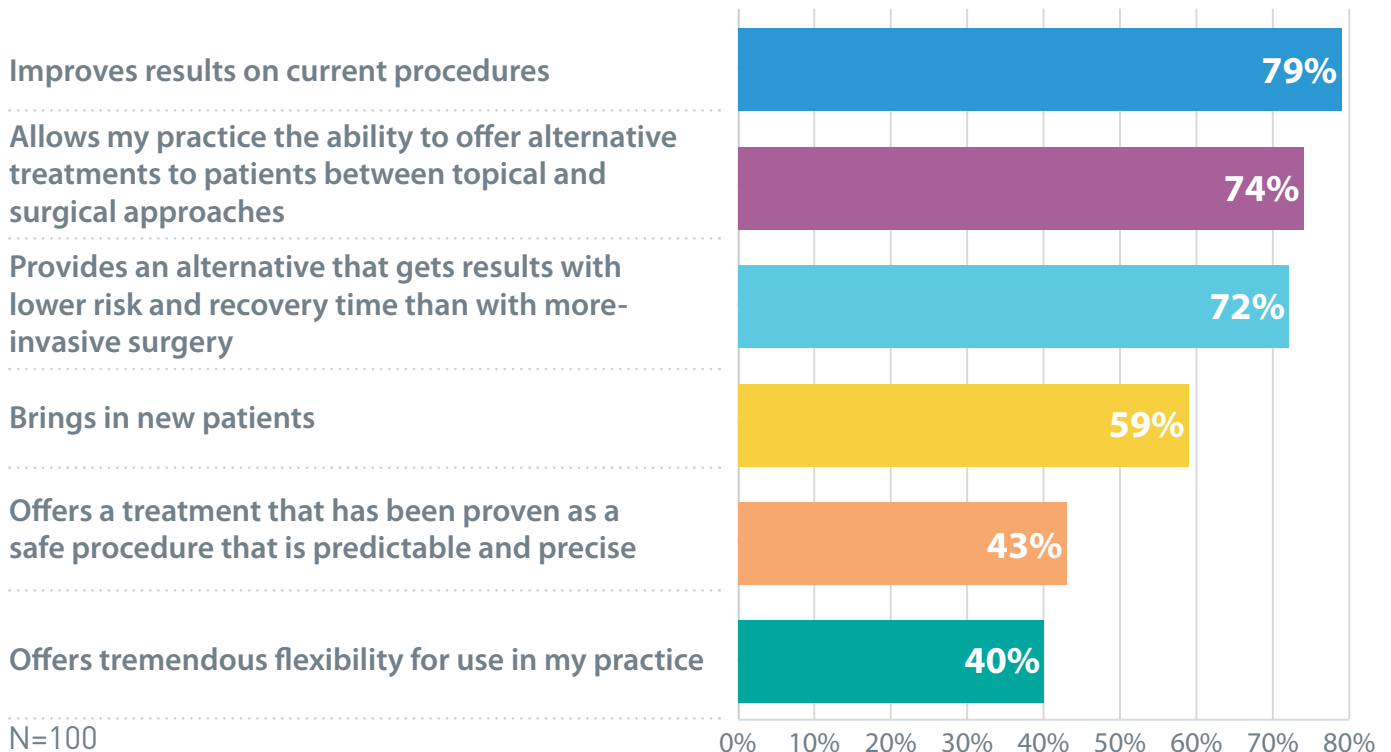

INTRODUCTION

Renuvion is a fast-growing technology which has shown exceptionally high utilization compared with other devices.^{1,2} To better understand this trend, and to assess the benefits of Renuvion which are driving its growth in the marketplace, a third-party survey was conducted among 101 existing users; the results are presented on the following pages.

(1) What percentage of your Renuvion procedures have been on patients who needed, but did not want more-invasive/excisional surgery?

(2) What are the benefits of using Renuvion for subdermal tissue contraction?

(3) Statements describing Renuvion

a. Compared with other energy devices, Renuvion allows for faster energy application times.

b. Renuvion allows for quicker tissue contraction than any alternative I have experience with.

c. I experience faster results with Renuvion than with other devices.

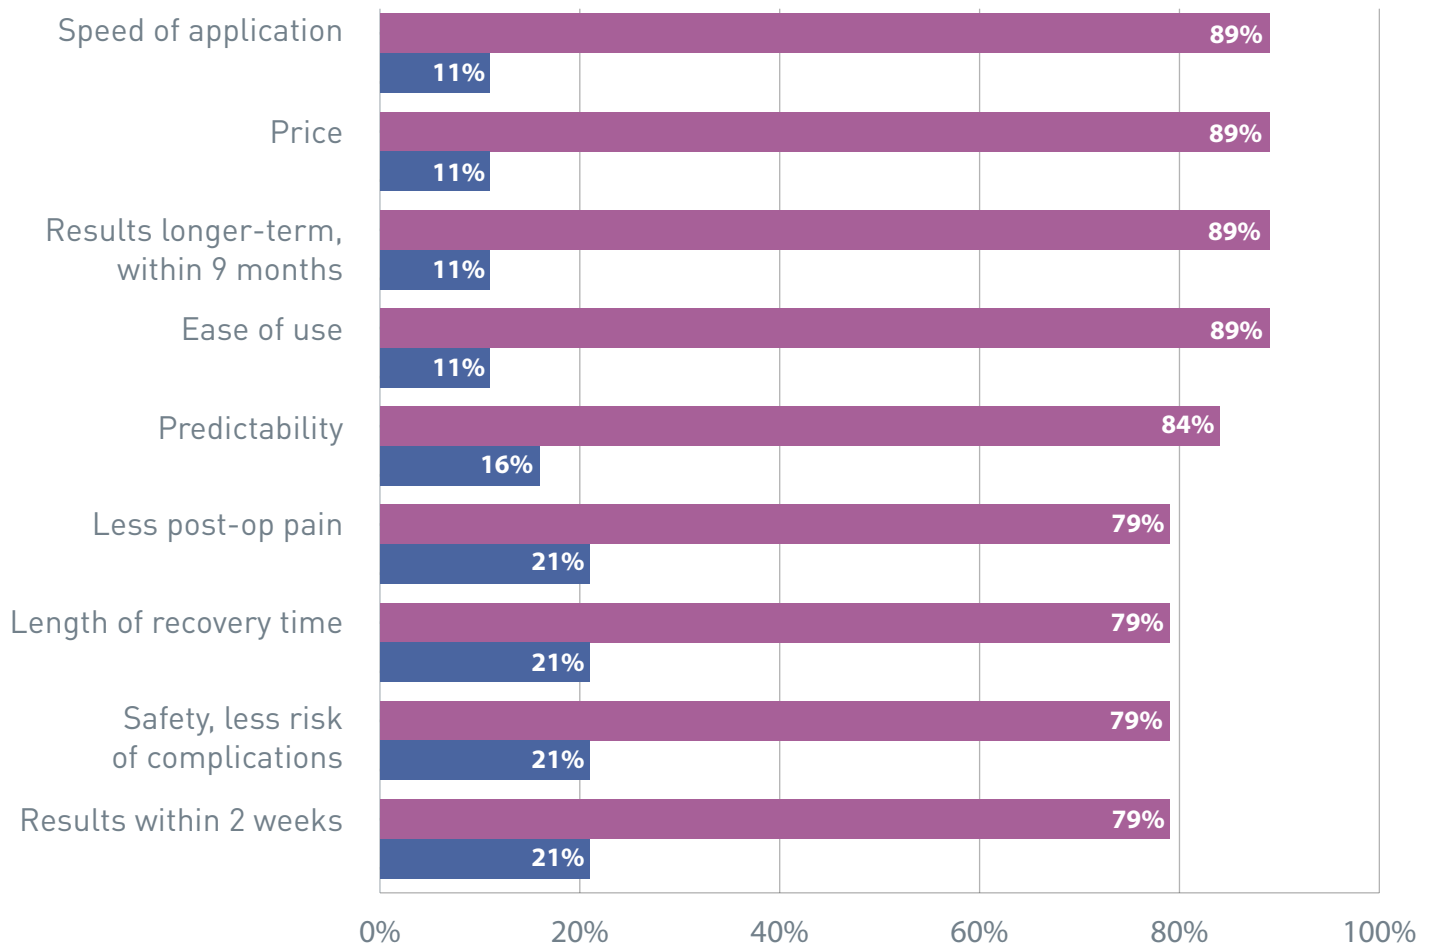

(3) Statements describing Renuvion continued...

d. Renuvion is a fast and easy system to set up and use.

N=100

(4) Comparing Renuvion with the bipolar RF-based device, which device performs better in the following areas?

N=19

■ Renuvion ■ Bipolar RF-based device

Risk associated with the use of Renuvion may include: unintended burns (deep or superficial), pneumothorax, scars, temporary or permanent nerve injury, pain, discomfort, gas buildup resulting in temporary and transient crepitus or pain, infection, hematoma, seroma; asymmetry and/or unacceptable cosmetic result. There may be additional risks associated with the use of other devices along with Renuvion and there may be an increased risk for patients who have undergone prior surgical or aesthetic procedures in the treatment area. As with any procedure, individual results may vary. As with all energy devices there are inherent risks associated with its use, refer to the IFU for further information.

The Renuvion system is intended to be used for the delivery of radiofrequency energy and/or a helium gas plasma for electrosurgical cutting, coagulation and ablation of soft tissue during open surgical procedures. The system is cleared for general use and not for any specific indication or anatomical location.
